Lifted Dec 13 2019 Before skyscrapers forever transformed the landscape of the modern metropolis, the conveyance that made them possible had to be created. Invented in New York in the 1850s, the elevator became an urban fact of life on both sides of the Atlantic by the early twentieth century. While it may at first glance seem a modest innovation, it had wide-ranging effects, from fundamentally restructuring building design to reinforcing social class hierarchies by moving luxury apartments to upper levels, previously the domain of the lower classes. The cramped elevator cabin itself served as a reflection of life in modern growing cities, as a space of simultaneous intimacy and anonymity, constantly in motion. In this elegant and fascinating book, Andreas Bernard explores how the appearance of this new element changed notions of verticality and urban space. Transforming such landmarks as the Waldorf-Astoria and Ritz Tower in New York, he traces how the elevator quickly took hold in large American cities while gaining much slower acceptance in European cities like Paris and Berlin. Combining technological and architectural history with the literary and cinematic, Bernard opens up new ways of looking at the elevator--as a secular confessional when stalled between floors or as a recurring space in which couples fall in love. Rising upwards through modernity,

Lifted takes the reader on a compelling ride through the history of the elevator.

Passenger Lift Traffic Analysis in Office Buildings Apr 16 2020

Lifts are installed in the buildings to satisfy the vertical transportation needs of their occupants and visitors. They are necessary to provide a comfortable means of transportation to the different levels in a building. Lifts play major role and provide a great deal of influence to the total function of a building, especially if the usage and numbers of elevator is not properly planned. The lift shafts are not easily modified in later stages of building development. Therefore the fundamental elevator design must be planned at the very beginning. The main objective of this project is to study the passenger lift traffic performance in office buildings. Six office buildings were visited. They are two in Putrajaya and four in Kuala Lumpur. The analysis was concentrated on the buildings with Elevator Management System (EMS). The EMS was used to capture the lifts performance data. The data were analysed based on the average waiting time (A WT) and the lifts traffic pattern. This study also was focused on the lift arrangement in the office buildings and zoning of the lifts. There is no specific law controlling the lifts quality of service. Poor quality of service can cause bad image, high maintenance cost

and can affect the building reputation. Building management will receive many complains and tenants will find another place for better quality of service. Result shows that the most importance criteria for lift quality of service is the waiting time. Waiting too long for lift can make people irritable i.e. waiting time more than 30 seconds. This can encourage vandalism and can cause lift to brake down. It can affect the lift safety and in worse case it can cause fatalities.

GB/T 24807-2021: Translated English of Chinese Standard. (GBT24807-2021) Sep 02 2021 This document specifies the electromagnetic disturbance emission limits and test conditions for lifts, escalators, and moving walks to be permanently installed in buildings. However, when wireless and television receiving equipment is used within the distances specified in Table 1, these limits may not provide complete protection against disturbances.
